## Technical & Managed Services

### Good Computing Practices

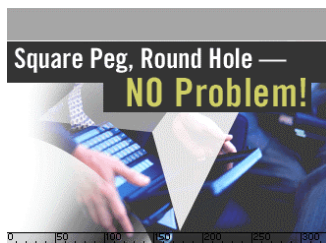

- Proven - Based on field experience
- Authoritative - Offer the best advice available
- Accurate - Technically validated and tested
- Actionable - Provide the steps to success
- Relevant - Address a real world problem

### Total Solutions

*Your system is as strong as its weakest link. Let eNSYNC help you find the weak links and offer alternatives to build a strong enterprise.*

### Network & Application Security

- Security risks - Enumerates the types of security hazards that affect your enterprise.
- Security strategies - Describes the general security strategies necessary to meet the risks.
- Network logon and authentication strategies - Includes authentication strategies for logging on to the network and for using remote access and smart card to log on.
- Information security strategies - Includes how you implement information security solutions, such as secure e-mail and secure Web communications.
- Administrative policies - Includes policies for delegation of administrative tasks and monitoring of audit logs to detect suspicious activity.

## Backup & Restore

*The business world depends on mission-critical data more than ever. As a result, organizations are placing a premium on protecting their IT assets from data loss and computer failure. eNSYNC offers detailed guidance based on the operating system platform. We can help you create and deploy backup strategies and discusses how to address these challenges. Proper administration is essential to your solution's success and for all necessary day-to-day maintenance procedures as well as data recovery procedures.*

## Infrastructure

- Operating Systems Audits - Identify control concerns and audit issues for Windows 95/98/NT/2000/XP systems. Review directory services, single sign-on security, access rights, and administrator privileges.
- Database Health – Is your database living up to its potential? Is it protected and secure? A series of short reports and health checks can quickly answer these questions. Don't get caught with your database down!
- IT Planning - Establish a skills inventory, identify staffing alternatives, and build a training program for your staff.
